

AI Agents Boutique - One-Page App Summary

Repo-grounded summary from `package.json`, `src/App.tsx`, `src/components/*`, `src/lib/*`, `Dockerfile`, and `docker-compose.yml`.

What It Is

Single-company AI agent operating system MVP. A founder seeds one company with Product, Engineering, and Design workers and runs chats, rituals, approvals, and work tracking from one browser UI. Repo evidence points to a local-first React/Vite app with browser persistence.

Who It's For

Primary persona: a founder/operator who wants one compact control surface for worker status, meeting cadence, approvals, and operating memory.

What It Does

- Seeds one company with three workers: Product, Engineering, and Design.
- Lets the founder message each worker through a direct chat line grounded in queue, blockers, approvals, and lessons.
- Runs structured rituals: 1:1, daily, weekly, retro, and lessons learned.
- Captures transcripts, summaries, decisions, notes, action items, and memory entries from meetings.
- Advances a work loop that updates work items, creates artifacts, and raises founder approvals for major changes.
- Shows dashboard signals for company pulse, blockers, approvals, projects, artifacts, and worker status.
- Generates read-only ritual recap links that can be shared or copied from the browser.

How It Works

- `App.tsx` switches Dashboard, Chat, Rituals, Work, Sidebar, and ContextRail.
- React `useReducer` actions call `lib/engine.ts` for init, messaging, meetings, work cycles, approvals, and action toggles.
- `lib/seed.ts` creates the company, workers, meetings, work, approvals, and memory.
- `lib/store.ts` saves `AppState` in `localStorage`.
`lib/share.ts` builds read-only ?share= recap links.
`lib/analytics.ts` stores share events locally.
- Backend, API, and model integration: Not found in repo.
Docker builds static assets and Nginx serves dist.

How To Run

- Install deps: `npm install`
- Start dev server: `npm run dev`
- Open: `http://localhost:4173`
- Optional checks: `npm test` and `npm run build`
- Pinned Node version / env setup docs: Not found in repo.
